

Gossamer Wallet

Smart Contract. Audit. Final report

Mikhail Vladimirov and Dmitry Khovratovich

13th September 2019

This document is the final review of the Gossamer Wallet smart contract performed by ABDK Consulting.

1. Introduction

We've been asked to review the Wallet smart contract given in a [public repo](#). The smart contract is a frontend for Compound tokens, making it easier to work with Compound tokens from multiple accounts.

2. Review summary

We have performed several iterations of the audit. Most of our comments and issues that we found were taken into account. The [current version](#) of the code, to our best knowledge, does not contain obvious flaws or bugs and can be used by third parties.

We only warn a potential user that if the contract is asked to redeem a too big amount of cTokens, then it does not fail but redeems the current balance and does not revert the transaction. Apart from that, we have not found any issues in this version of the wallet.
